Assignment 1 - Git & GitHub Fundamentals

Report

- **Full Name:** SADIK YASSINE
- **Student ID:** 154097
- **Course Code & Section:** [CSC3324 02, Group C]
- **GitHub Username:** Syassine48
- **Repository:** https://github.com/Syassine48/git-session1-Syassine48

1. Repository Setup

I created the folder git-session1-Syassine48 from the STARTER files and ran "git init -b main" inside it. I then created a .gitignore that ignores local.env and all *.log files. I added the rule !important.log so that important.log stays visible to Git. I checked the result with "git status --ignored".

2. README & Commit History

My README.md contains my name, GitHub username, a short description, the technologies used, one code block, one link and the provided project banner image. I made small commits that each have one purpose: the .gitignore, the starter files, the README, the overview text in index.html, the status message in app.js, the heading style in style.css, the About page and a console log in app.js.

3. Selective Staging

I edited style.css and app.js at the same time. I ran "git add style.css" and then "git status", which showed style.css under changes to be committed and app.js under changes not staged. I committed only style.css, and app.js stayed modified until later.

4. Branch & Merge

I created the branch feature/about with "git switch -c feature/about". On it I added about.html and a link in index.html, and committed. I returned to main with "git switch main" and ran "git merge --no-ff feature/about", which created a merge commit that shows the branch in the history.

5. Remote Changes

A commit saves a snapshot only in my local repository, while a push uploads my commits to GitHub. I edited README.md directly on GitHub, then ran "git fetch". "git status" showed my local main behind origin/main by one commit, and my local files had not changed.

6. Fair Use of AI

I used Claude to guide me through the assignment steps. I asked how to structure my commits, how to write the .gitignore rules, how to do selective staging, and how to fix errors such as running git init in the wrong folder and the "nothing to commit" message.

7. Sources & Reflection

Sources: Pro Git book (https://git-scm.com/book/en/v2), the Session 1 course material, and Claude for guidance.

Reflection: The hardest concept was the difference between the working directory, the staging area and the commit history. When Git behaves unexpectedly, I first check that I am in the right folder with pwd, then run git status to see the current state
